Submit Checklist

A dynamic, interactive checklist for on-site inspections. Technicians check off items, add comments, and track completion via a progress bar. When finished, results are submitted back to Salesforce in one click. Tied to a specific asset or facility record.

3. HSE Incident Map

HSE Incidents

Name	Type	Severity	Status	Date	Location
0042	Explosion	Critical	Open	Sep 4, 2026	Golf
0036	Vehicle	Critical		Aug 26, 2026	USA
0020	Fire	Critical	Investigating	Jun 24, 2026	Morocco

Surfaces all Health, Safety & Environment incidents in one view. Displays incident name, type, severity, status, date, and location in a sortable data table. Linked to wells and facilities for full operational context.

6. Permit to Work Board

Manages the full permit lifecycle from Requested → Issued → Completed → Cancelled. Each permit is a card on the board. Supervisors advance status with one click. Summary counters show permits by status. Click any card for full permit details.

7. Production Allocation Report

Breaks down oil, gas, and revenue allocation for a well over a selectable period (3, 6, 12, or 24 months). Shows working interest and net revenue interest percentages per period. Summary cards display total oil (bbls), gas (MCF), and revenue.

8. Well Production Chart

Visualizes a well's oil, gas, and water production over time. Summary cards show totals, a data table provides period-by-period detail, and a custom horizontal bar chart gives an at-a-glance view of production proportions.

Oil (green), Gas (grey), Water (blue).

5. Market Data Home

A trading-terminal-style dark UI pulling live prices from OilPriceAPI and EIA. Shows spot prices as bar charts, supply agreement pricing with variance analysis (current price vs. spot), and national inventory benchmarks. Syncs automatically.

Portal-Facing Components (Experience Cloud — Dark Theme)

9. Portal Dashboard

The landing page for external partners. Four KPI gauges show Total Wells, Active Incidents, Critical Incidents, and Permits Due within 60 days. Below: recent HSE incidents, upcoming compliance deadlines, and a 6-month production summary per well.

10. Portal Well Status

Partners monitor their wells in real-time. Filterable well list with status counts. Select a well to see 12-month production history (oil/gas/water volumes) and a live telemetry grid showing the last 24 hours of pressure, temperature, and flow readings from SCADA.

11. Portal HSE Incident Form

External partners report and track incidents directly. Severity-based KPI chips, a full incident creation form (type, date, severity, location, description, spill volume), a filterable incident list, and a detail panel showing corrective actions.

12. Portal Compliance

Partners see their compliance standing at a glance. Four KPI gauges (active permits, expiring, expired, overdue reports), a horizontal calendar strip with upcoming deadlines, and filterable tables for permits and compliance reports.

13. Portal Invoices

JV partners view invoices and royalty statements. KPI gauges for total invoices, outstanding/overdue amounts, and 12-month royalty totals. Filterable invoice table and a royalty statement showing production volumes, working interest, NRI, allocated revenue, and severance tax per well.

AI Agent Architecture

14. Agent Summary — O&G Operations Assistant

Agent Summary

A visual map of the AI agent architecture powering the O&G Operations Assistant. The top-level agent is a hands-on field-ops copilot for HSE, compliance, production, permits-to-work, and terminal inventory. An Agent Router welcomes the user and routes each conversation to the right domain subagent based on intent, branching out to seven specialists: Ambiguous Question (redirects when a request is unclear), Compliance Analyst (permit renewals, expirations, and overdue compliance reports), Escalation (hands off to a live human agent), HSE Advisor (incident handling, severity classification, and regulatory reportability), Off Topic (redirects conversations that drift away from O&G topics), Ops (permits-to-work, field inspections, pipeline integrity, and terminal tank inventory), and Production (well production history, well status, wells due for abandonment, and production allocation).

Slack Integration — Automated Alerts

15. Critical HSE Incident Slack Alert

The screenshot displays a Slack interface with two critical HSE incident alerts from the O&G HSE Alerts app. The alerts are for an explosion and an environmental incident, both reported by Abdelmoumen Addouli. To the right, a detailed view of HSE Incident 0043 is shown, listing various attributes like status, location, and severity.

HSE Incident 0043	
HSE Incident 0043	Status: Open
Incident Type: Environmental	Injury Type:
Severity: Critical	Fatality Occurred:
Incident Date: 9/5/2026	LTI:
Location: Morocco	Spill Volume (bbls):
Account:	Environmental Impact:
Well: petrum	Recordable:
Pipeline:	Regulatory Reportable:

Automated Slack notification for HSE incidents. When an incident record's severity is updated from Low to Critical in Salesforce, the O&G HSE Alerts app posts an instant “CRITICAL HSE INCIDENT” alert to Slack, showing the incident type, location, date, and who reported it, with a direct link back to the record in Salesforce. In this example, HSE Incident 0043 — an Environmental incident in Morocco linked to well petrum — was escalated to Critical severity, which triggered the alert shown on the left, keeping the team informed in real time without needing to check Salesforce directly.
